CARON offers new line of “earth-friendly” products

(Marietta, OH, March 9, 2009) Caron Products and Services, Inc. has introduced its newest “family” of products in an effort to promote environmental stewardship. The staff of highly-trained professionals at CARON continue to research ways to not only create a top-quality and attractive lineup of Environmental Chambers and Incubators, but to offer several “earth-friendly” technologies. These innovative Environmental Chambers and Incubators are “earth-friendly” in several unique ways.

The newly designed 25 cubic ft. and 10 cubic ft. series of Environmental Chambers and Incubators include “greener” technologies.

All Environmental Chambers contain what is known as **gVapor™** (steam free humidity system) and **gRod™** (refrigeration on demand). The **gVapor™** humidity system delivers controlled humidity without wasting energy or generating heat. The new **gRod™** control system efficiently manages power consumption. Both **gRod™** and **gVapor™** not only reduce energy consumption, but contribute to lower utility expenses.

CARON’s second generation Universal Condensate Recirculation System (CRYS102) is designed to recycle and utilize tap water, minimizing water consumption and lowering utility and installation expenses. It also eliminates the need to purchase water purification systems or maintain a supply of deionized water. The CRYS102 acts as a water delivery system compatible with any CARON humidity controlled chamber.
